DEEP

Decision-grade calibration. C-OPT Reasoning Engine – max-effort extended thinking across all four spaces (Problem, Solution, Model, Operation), full reasoning trace, schema-completeness gating. Each space runs the full MDM stack: hypothesis → evidence → falsification → Bayesian update → schema audit. The 30-50 minutes per cycle is the methodology, not waste – competing tools are faster because they skip the methodology. Suitable for analyst production output, planning artifacts, OPORD/WARNORD export.

Gemini's Innovation Lab systematically integrates AI to enhance situational awareness, accelerates decision-making, and contributes to the US transition to an AI-enabled force. It develops prototypes, performs tests, and scales solutions for Gemini customers and priority initiatives.
